

LCRI Scientific Site Report

Scientific Brief: Burera

1. Site Description

- **Name** : Burera
- **Date Generated** : 2026-08-14 16:56
- **Geometry Type** : Polygon
- **Extent** : 0.00

2. Data & Methods

Analysis leverages the ****ESA CCI Biomass v6.0**** (or NASA/ORNL if configured) dataset. The Local Carbon Return Index (LCRI) metrics are computed using deterministic zonal statistics across the site's footprint. The AGB trend is calculated using a linear regression over the available temporal sequence.

3. Results

- **Area** : 0.00
- **Mean Above-Ground Biomass (AGB)** : 51.9 Mg/ha
- **AGB Trend** : +1.20 Mg/ha/yr
- **Carbon Stock** : 1,590,009 Mg
- **CO2e Potential** : 5,835,332 Mg

4. Interpretation

The site is performing exceptionally well, with strong positive growth in above-ground biomass.

5. Recommendations

High potential for carbon credit validation. The site is actively sequestering carbon above baseline.
